yadm is a tool for managing [dotfiles](#).

- Based on [Git](#), with full range of Git's features
- Supports system-specific alternative files or templated files
- Encryption of private data using [GnuPG](#), [OpenSSL](#), [transcrypt](#), or [git-crypt](#)
- Customizable initialization (bootstrapping)
- Customizable hooks for before and after any operation

Complete features, usage, examples and installation instructions can be found on the [yadm.io](https://yadm.io) website.

## A very quick tour

```
# Initialize a new repository
yadm init

# Clone an existing repository
yadm clone <url>

# Add files/changes
yadm add <important file>
yadm commit

# Encrypt your ssh key
echo '.ssh/id_rsa' > ~/.config/yadm/encrypt
yadm encrypt

# Later, decrypt your ssh key
yadm decrypt

# Create different files for Linux vs MacOS
yadm add path/file.cfg##os.Linux
yadm add path/file.cfg##os.Darwin
```

If you enjoy using yadm, consider adding a star to the repository on GitHub. The star count helps others discover yadm.
